                                                                                                                                                                                                                                                    ઠે
                                                                                                                                                                                                                                                                                셤
                                                                                                                                                                                                                                                                                                                                                                            acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomerlectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but ftp.wipo.int/pub/published_pct_sequences

range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invantion. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at the printed specification, but fip.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABF82073 represent the oligomers described in the invention.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF9989, ABH00010-ABH9989 and ABI00010-ABI82073 tepresent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

                                                                                                                                                                                                                                                                                                                                                                                                      8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes novel oligonucleotide primers or peptide nucleicacid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE99999, ABE00010-ABE99999, ABH00010-ABE99999, and ABI00010-ABI99999 and ABI00010-ABI99999. represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABH82073
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABR00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                            SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                      Oligonucleotide primer SEQ ID NO 337282 for detecting SNP TSC0039782.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Oligonucleotide primer SEQ ID NO 315110 for detecting SNP TSC0026719.

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovaerular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC001016-ABC9989, ABR00010-ABH99989 and ABI00010-ABH92073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretraated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation, ABC0010-ABC9989, ABF00010-ABE9989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

ö This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretraeted genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABE09989, ABF00010-ABE9989, ABF00010-ABE9989, ABF00010-ABE9989, and ABI00010-ABE9989 and ABI00010-ABE90010 represent the oligomers described in the invention. NOTE: The sequence was obtained in electronic format from WIPO at the printed specification, but the wipo.int/pub/published_pct_sequences This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nuclectide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic. Oligonucleotide primer SEQ ID NO 354578 for detecting SNP TSC0049156. Gaps oet or oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine methylation status. .; 0 Claim 1; SEQ ID NO 354578; 29pp + Sequence Listing; German. 33.8%; Score 8.8; DB 1; Length 12; 83.3%; Pred. ABI58281

Lapa SA;

```
The invention relates to novel species-specific identification of orthopoxviruses by preparing a biochip with immobilized oligonucleotides on a gel micromatrix on a glass support, amplifying a crmB gene fragment by two-stage asymmetric PCR using a fluorescence-labelled primer, hybridizing the resulting single-stranded DNA on the biochip by incubation in a sealed chamber, and detecting fluorescence and comparing the hybridization pattern with standards. The method is used for species-specific identification of orthopoxviruses, including variola, monkeypox, compox, vaccinia and rabbitpox viruses. This primer is general for
                                                                                                                                                                                                                                                                                                                                                                          Species-specific identification of orthopoxviruses comprises hybridizing crmB gene fragments on a biochip bearing typing oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          chromosomal abnormality, maternal locus; genetic disorder; foetus; mutation; translocation; transversion; monosomy; trisomy 21; chromosome 21; Down's Syndrome; anueoplodies; chromosome addition; chromosome addition; chromosome amplification; chromosome translocation; chromosome rearrangement; single nucleotide polymorphism detection; SNP detection; pregnant female; PCR; primer; so.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             acid (PNA) oligomers for detecting single nuclectide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomuclocides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE99999, ABR00010-ABE99999, ABR00010-ABE99999 and ABI00010-ABE92073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nuclectide polymorphisms (SNP)
                                                                                                                                                                          SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                   Oligonucleotide primer SEQ ID NO 358254 for detecting SNP TSC0007531.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       primer, ss; species-specific identification; orthopoxvirus; biochip; micromatrix; crmB; variola; monkeypox; cowpox; vaccinia; rabbitpox.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                            It can be used to detect any alterations in a gene sequence, especially single nucleotide polymorphisms (SNPs), and may be used to detect numerous abnormalities simultaneously, for example if several SNPs are associated with a particular disease. The method provides a rapid, noninvasive method for determining the sequence of DNA from a foetus using sample from a pregnant female, for example to detect genetic disorders as above or to determine if a foetus is a carrier of a disease or
                                                             Detection of chromosomal abnormalities e.g. Down's Syndrome, non-
invasively in a fetus, comprises forming a ratio of amounts of alleles at
a locus of interest and a different heterozygous locus.
                                                                                                                                                                                                                    disorders,
                                                                                                                                                  abnormalities by determining the sequence of alleles of a locus of interest from template DNA, determining which alleles are present and comparing to amounts of alleles at a different, selected heterozygous locus (for example on another chromosome or a maternal locus); relative amounts are expressed as a ratio indicating presence or absence of the abnormality. The method is useful for the detection of genetic disorders especially in a foetus, including chromosomal abnormalities and mutations, for example translocations, transversions, monosomies, trisomies (for example trisomy 21 in which an additional copy of chromosome 21 results in Down's Syndrome) and other anueoplodies, deletions, amplifications, translocations and rearrangements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                          This invention relates to a novel method of detecting chromosomal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ss; nicking agent; assay panel; diagnosis; expression pattern; DNA fingerprinting; nosocomial infection; microbiological assay; bacterial contamination; genome mapping; bioremediation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The invention relates to a method of treating a nucleic acid sample with components under nicking conditions, where the components comprise a components under nicking conditions cause the nicking agent to nick the nucleic acid sample to thus produce a family of initiating considered in a subjecting one or more members of the family of initiating oligonucleotide fragments to a characterization process to thus provide results. The method is useful for creating an assay panel of diagnostic oligonucleotides that can identify any organism or individual. The method is useful for characterizing other DNA conformation and section of a useful for identifying the source organism of a nucleic acid sample e.g., bacterium, fungus, virus, plant, con-human animal or human. The method is particularly useful for rapidly fingerprinting DNA to identifying prokaryotic and eukaryotic species. Chingerprinting DNA to identifying different bacterial strains involved in e.g., nosocomial infections. Furthermore, the method is useful for identifying different bacterial strains involved in e.g., nosocomial infections. Furthermore, the method is useful for diagnosing bacterial disease in plants and humans, monitoring for diagnosing bacterial disease in plants and humans, monitoring for contamination, monitoring quality assurance/quality control of bacterial contamination, monitoring quality assurance/quality control of contamination and/or outbreaks of bacterial infections, genome mapping, monitoring bioremediation sites, and for monitoring agricultural sites for test crops, bacteria and recombinant molecules. This sequence corresponds to nucleic acid used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
Identifying nucleic acid sample source, useful for identifying bacterial strains involved in nosocomial infections, comprises treating the nucleic acid sample with components comprising a nicking agent under nicking conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ss; chromosomal abnormality; detection; foetus; translocation; transversion; monosomy; trisomy; aneuploidy; deletion; addition; amplification; prenatal diagnosis; PCR; primer; SNP; single nucleotide polymorphism; human; multiplex; TSC08701940.

Detecting presence or absence of nucleic acid, containing mutation, involves isolating nucleic acid from sample containing cell lysis inhibitor, and detecting presence or absence of nucleic acid.

Example 13; Page 258; 440pp; English.

The invention relates to a method for detecting a nucleic acid, involving isolating a nucleic acid from a sample, where an agent that impedes cell isolating a nucleic acid from a sample, where an agent that impedes cell that was added to the sample, and detecting the presence or absence of the nucleic acid. The invention also relates to a method for detecting the nucleic acid. The invention a sample of a pregnant female. The nucleic acid contains at least one mutation chosen from a single point mutation, adeletion, a family at frameshift, a truncation, adeletion, an insertion, arransversion. The method is useful for detecting cutations, and a transversion. The method is useful for detecting cutations, and a transversion. The method is useful for detecting cutations, and a source chosen from bacteria, protozoa, molds, yeasts, plants, humans, conn. humans, multi-cellular parasites, animals and archaebacteria. The method is useful for detecting, diagnosing or monitoring a disease such as cancer chosen from carcinoma of the bladder, breast, bronchus, colon, kidney, liver, lung, oesophagus, gall bladder, ovary, pancreas, stomach, cervix, thyroid, prostate and skin, small cell lung cancer, aguamous cell carcinoma, haematopoietic tumours of lymphona, haematopoietic tumours of lymphona, haematopoietic tumours of lymphona, haematopoietic tumours of myeloid lineage, acute and chronic myelogenous leukaemias, myelodysplastic syndrome and promplemed correct betakenia, tumours of the central and peripheral nervous system, chabitomyosarcoma, tumours of the central and peripheral nervous system, chaptering reservance to the entral and schwannoma, mellod, maniform, myelod, myelod, myelod, mye monitoring response to treatment chosen from surgery, radiation, lifestyle change, dietary protocol and supplementation and administration of a drug is chosen from chemotherapeutic agents, antibacterial agents, anti-lifungal agents, targeted-cancer drugs, cytotoxic agents, cytostatic agents and anti-proliferative agents. This sequence represents a PCR primer used in the scope of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of a human connective tissue growth factor (CTGF) cDNA fragment (nucleotides 589-600) that corresponds to a mRNA target of anti-searring ribozymes of the invention. CTGF is a factor known to be involved in scar formation. The invention relates to ribozymes that specifically target and destroy mRNA sequences encoded by specific CTGF DNA sequences ADU73094-ADU73799 such as the present sequence. The ribozymes can be in hammerhead configuration ADU73740-CC ADU73741. Methods and compositions for treating scarring conditions associated with increased expression of CTGF are provided, as well as cells containing anti-CTGF ribozymes and vectored anti-CTGF ribozymes contistable for delivery to cellular targets capable of CTGF expression. In a cell, a claimed method for reducing CTGF mRNA or protein expression in a cell, a claimed method for reducing CTGF mRNA or protein expression in a cell, a contacted with a vector comprising a nucleic acid that encodes at least cone ribozyme that specifically cleaves a target RNA sequence encoded by a CTGF gene. The cell may be a fibroblast, and the tissue may be from a cubic thaving, or at risk of developing, a condition causing a scar. The condition is a fibrotic disorder selected from scleroderma, keloids, condition is a fibrotic disorder selected from scleroderma, teloids, claver capaule adhesions, burn scars, spinal cord injuries, bile contained in the condition may all subcome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

more decanucleotides (AAQ96406-Q97018) from the nef gene and/or 1 or more decanucleotides (AAQ991019-Q97106) from the LTR region; the sequence of AAQ96406 corresponds to nucleotides 1-10 of the nef gene (AAQ96141). The responds to nucleotides 1-10 of the nef gene (AAQ96141). The response in humans, and enable the generation of therapeutic, diagnostic and targeting agents against HIV-1 infection. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A novel method for the detection of plant pathogenic strains of fungine 5. Septoria nodorum, S.tritici, Pseudocercosporella herpotrichoides, Mycosphaerella fijiensis, M.musicola or Fusarium app, involves the PCR amplification of sequences found in the internal transcribed region (ITS) of the 185, 5.88 and 288 ribosomal RNA genes by the primers AAQ94359-93 and AAT05357-72. These primers are derived from the ITS sequences of these fungi (AAT05394-TD5404 and AAQ94398) and are strain specific. The amplification products of the reactions using these primers can be used with the capture primers AAT05399-93 in colourimetric assays. The primers and ITS DNAs can be used for the detection of specific fungal pathogen isolates and in monitoring disease development in plant populations. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Plant pathogen; fungue; Septoria nodorum; Septoria tritici; Fusarium; Pseudocercosporella herpotrichoides; Mycosphaerella fijiensis; PCR; Mycosphaerella musicola; amplification; primer; ribosomal RNA gene; internal transcribed region; strain; capture; colourimetric assay; isolate; development; population; random amplified polymorphic DNA; ss.
                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DNA encoding intervening transcribed sequence - used for detection of plant fungal pathogens.
                                                                                                Attenuation of pathogenic HIV-1 strain NL4-3 involves deletion of 1
LTR region - can be used in a vaccine to inhibit/reduce productive infection in an individual by a pathogenic strain.
                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAT35710-T35738 represent amplification primers used in a random amplified polymorphic DNA (RAPD) reaction on V.dahiae DNA. These sequences were used to isolate the sequence represented by AAT35706 for use in the diagnostic assays of the invention. The qualitative assays of the invention. The qualitative assays of the invention comprise analysing a sample for the presence of the sample to the infected by V.dahilae. A quantitative assay of the invention, comprises taking a sample and isolating nucleic acids from it. A sequence that acts as an internal standard (see AAT3570*) is added to the isolated nucleic acids. The internal standard competes with the V.dahilae sequence for the PCR primers used in the reaction (such as the sequence for the PCR primers used in the reaction of the internal standard is a different size to the amplified portion of the internal standard is a different size to the amplified portion of the internal standard is a different size to the amplified portion of the internal field that is going to be used for growing potatoes. These assays are faster and more accurate than methods based on culturing soil samples in selective media. The assays can also distinguish between V.dahilae and V.albo-atrum. By using these assays, unnecessary soil
                                                                                                                      ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequences AAV62567 to AAV62571 represent random amplified polymorphic DNA (RAPD) primers used in the course of the invention for detection of Septoria species. The invention provides a DNA molecule isolated from the ribosomal RNA gene region of a fungal pathogen, where the DNA molecule consists of an internal transcribed spacer (ITS) sequence selected from ITS2 and ITS2 of Fusarium quaminearum, Pusarium moniliforme, Septoria avenae or Microdochicum nivale. A method for detecting F. graminearum, F. culmorum, F. moniliforme, F. poae, F. svenaceum and M. nivale isolates is also provided which comprises isolating DNA from a plant leaf infected with at least one of the above pathogens and amplifying parts of the ITS sequence of the pathogen (s) by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The pathogen(s)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                              Nilaparvata lugens Stall rice. The method comprises: (1) amplification of a DNA fragment by PCR using a PCR marker and detection of the resistance, in which a DNA fragment being specifically amplified in a species having a gene (bph-2) resistant to Nilaparvata lugens Stal. using a genome DNA of rice as a template and 1.3 KDp in total with a base sequence shown by sequence 1 (AAZOB315). comprising 300 bases at 3'-terminal, respectively; and (2) a PCR marker comprising 290 bases at 3'-terminal, respectively; and (2) a PCR marker comprising a sense primer of base numbers shown in sequence 3 (AAZOB314) and antisense primer of base numbers shown in sequence 5 (AAZOB314). The present invention also describes a primer for PCR using rice genome of sequences 9, 10 or 11 (AAZOB314), respectively, for detection of the resistance. The method is used for the simple detection of resistance to Nilaparvata lugens Stal
                                                                                                                           Nilaparvata lugens Stal; rice; detection; resistance; PCR marker; bph-2;

```
The present sequence represents a potential triple-helix forming region. It can be used to demonstrate the assay of the invention. The assay comprises adding a sample containing double-stranded DNA test sequences, e.g. containing the present sequence, to an aqueous medium containing at least one complex of anchor DNA, attached to a solid support, and reporter DNA, where either a part of the anchor DNA or reporter DNA is designed to form a triple-strand structure with part of the test sequence. Triplex formation results in displacement of the reporter DNA which is detected as an indication of the presence of the DNA test sequence. The method is used to detect DNA sequences, particularly for identification of bacteria (by detecting genes for ribosomal RNA) in clinical samples, but also detection of oncogenes and Hepatitis B virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SAGE tag, serial analysis of gene expression; antigen-presenting cell; APC; moncoyte-derived dendritic cell; differential gene expression; immunostimulatory cofactor; costimulatory factor; CTL; cytotoxic T-lymphocyte; tumour antigen; immunotherapy; anticancer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Assay of genetic sequences based on triplex formation from double stranded analyte - and hybrid of anchor and reporter sequences, with reporter released if triplex formation occurs, used e.g. to identify bacteria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Sequences AAZ77573-Z79709 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts encoding immunostimulatory cofactor proceins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while correspond to novel genes. Antigen-presenting cell cher transcripts correspond to novel genes. Antigen-presenting cell cher transcripts correspond to novel genes. Antigen-presenting cell cher transcripts correspond to novel genes. Antigen-presenting cell cativation of the cytotoxic immune response, particularly against tumour cells, immunostimulatory cofactors also being required for activate a robust cytotoxic immune response that can lyse the tumour cells, immunostimulatory cofactors also being required for sefficient activation of cytotoxic 7-lymphocytes (CTLs). Nucleic cild sefficient activation of cytotoxic 7-lymphocytes (CTLs). Nucleic cild sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; no screen for an APC; and as hybridisation probes/amplification primers for the dagnosis, prognosis and monitoring of differentially expressed genes in complex. Complex of the dendritic cell differentially capteres and monitoring of diseases related to abnormal expressed of antigen specific effector cells) and vectors containing them are used in active immunotherapy (or to stimulate production of a prognesus and monitoring of diseases. Cells as belonging to the monocyte lineage. Cells containing these genes copially of antigen specific effector cells) and vectors containing them are used in gene therapy. Co-administration of tumour antigens and presentation of co-stimulatory signals, migration of chemoty secretio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated polynucleotides differentially expressed in antigen-presenting cells, useful in gene vaccines against cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 1; Page 116; 130pp; English

Sequences AAZ77573-279709 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts encoding immunostimulatory cofactor proceins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTs (expressed sequence tags) which were previoually unknown to be cother transcripts correspond to novel genes. Antigen-presenting cell cother transcripts correspond to novel genes. Antigen-presenting cell cother transcripts correspond to novel genes. Antigen-presenting cell activation of the cytotoxic immune response, particularly against tumour cells. Tumour antigen presentation via the MHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone activated a robust cytotoxic immune response that can lyse the tumour cells, immunostimulatory cofactors also being required for efficient to activate a robust cytotoxic T-lymphocytes (CTLS). Nucleic acid sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for agents that modulate expression of diseases related to abnormal expression of these genes, or of their encoded proteins, call differentially expressed genes, or of their encoded proteins, call so the dending to the dending coll and vectors containing these can be used in gene therapy. Co-administration of tumour antigens and continue therapy. Co-administration of tumour antigens and presentation to endogenous APC ensemble or the procession of the dending presentation to costimulatory signals, migration to T cell-rich sites, presentation to creaminatory signals, migration to T cell-rich sites.

activation of the cytoxic immune response, particularly against tumour activation of the cytoxic immune response, particularly against tumour cells. Tumour antigen presentation via the MHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cytotoxic immune response that can lyse the tumour cells, immunostimulatory cofactors also being required for efficient activation of cytotoxic T-lymphocytes (CTLS). Nucleic acid sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for against a tumour antigen; to modulate the genotype of an APC; to screen for against a tumour antigen; to modulate in modulate expression of differentially expressed genes in APC; and as hybridisation probes/amplification primers for the diagnosis, prognosis and monitoring of diseases related to abnormal expression of these genes. Detection of the dendritic cell differentially expressed genes, or of their encoded proteins, can be used to identify cells as belonging to the monocyte lineage. Cells containing these genes can be used in active immunotherapy (or to stimulate production of a population of antigen-specific effector cells) and vectors containing the associated characterismination general energy of the manner administration of tumour antigens and antigen and active farmines admines antigen antigen antigen and antigen antigen and antigen antigen and antigen and antigen antigen and antigen antigen and antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      expression) tags used to identify mana transcripts encoding immunostimulatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTs (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while other transcripts correspond to novel genes. Antigen-presenting cell (APC)-associated costimulatory factors play an important role in the
Isolated polynucleotides differentially expressed in antigen-presenting cells, useful in gene vaccines against cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         APC-associated costimulatory factors ensures adequate antigen presentation to endogenous APCs and upregulates the APCs for the presentation of co-estimulatory signals, migration to T cell-rich sites, secretion of T cell growth factors and secretion of chemokines for recruitment of immune effector cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps that are preferentially transcribed in the metastatic breast tumour that are preferentially transcribed in the metastatic breast tumour cells). AAZ8942 that are preferentially transcribed in metastatic breast tumour cells). AAZ8942 to AAZ86677 represent tags corresponding to distinct transcribts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, monitoring and creatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions.

Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcribts are used to direct expression, in selected cell types, of c.g. therapeutic genes (also ribozymes or antisense sequences).

CC e.g. therapeutic genes (also ribozymes or antisense sequences).

CC e.g. therapeutic genes (also ribozymes or antisense sequences).

AAZ83942 crissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour citisue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, monitoring and transcripts can be used for diagnosis, monitoring and transcripts cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigenes cancer expression of the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising specific cantibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antispense can be used to expand and isolate populations of educated, antispense used for adoptive calls, calls, calls, calls, calls, calls, calls and these used for adoptive

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                              Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also Tibozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic antibodies (ab) and are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic I lymphocytes, and these used for adoptive
                                                                                                                                                                                                                                                                                                 AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions.
                                                                                                                                                                                                                         Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and

that are preferentially transcribed in the metastatic breast tumour cells). AAZ80767 to AAZ80341 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). AAZ80342 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These tissue (i.e. are downrequlated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides or as therapeutic and isolate populations of educated, antispense sed for adoptive cells, e.g. cytotoxic I lymphocytes, and these used for adoptive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        that are preferentially transcribed in the metastatic breast tumour transcripts tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ883942 to AAZ88677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is treatment of breast cancer, particularly where metastatic. Diagnosis is compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of particularly an antigen-encoding sequence for use in gene or cell-based vaccines Polypeptides encoded by the transcripts are also useful in vaccines for diagnosing breast cancer and for raising specific antiboddes (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic T lymphocytes, and these used for adoptive immunotherapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour cells). AAZ83942 corresponding to distinct transcripts that are preferentially transcribed in metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These crissue (i.e. are downrequiated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and creatment of breast cancer, particularly where metastatic. Diagnosis is compounds that modulate expression of the transcripts are potentially cuseful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

thas are preferentially transcribed in the metastatic breast tumour thas are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ8342 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and compounds that modulate expression of the transcripts are potentially useful for transment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences).

CC oparticularly an antisen-encoding sequence for use in gene or cell-based corrines, for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter and isolate populations of educated, antigen-specific immune effecter cells, and these used for adoptive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

that are preferentially transcribed in the metastatic breast tumour that are preferentially transcribed in the metastatic breast tumour cells. AAZ86071 represent tags corresponding to distinct transcribes that are to AAZ86677 represent tags corresponding to distinct transcribes that are to AAZ86677 represent tags corresponding to distinct transcribes that are corresponding to distinct transcribes that are corresponding to non-metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and corresponding to breast cancer, particularly where metastatic Diagnosis is compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic agenes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic T lymphocytes, and these used for adoptive immunotherapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and

                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes 100 human genes, which are expressed most frequently in human monocytes. The CDNA of each gene has a sequence fully defined in the specification, and lacking the CAYG sequence located adjacent to polyA region. Also described are: (1) an antibody considered to consider the protein encoded by any of the genes; (2) colliquoudleotides obtained from the CDNA sequences; (3) 380 human genes which are expressed most frequently in human macrophages; differentiated from human monocytes by granulocyte-macrophage colony-stimulating factor, the CDNA of each gene has a fully defined sequence, given in the specification, lacking the base sequence CATG located most closely to the specification, lacking the base sequence CATG located most closely to the poly A region; (4) an antibody specifically for the protein encoded by carry of the genes of (3). The genes and CDNAs, are used for the study of gene specificity and disease onset mechanism e.g. oncogenesis, genetic diseases, drug development and diagnosis. AAASSGIOT to AAASSGESE represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                      Genes most frequently expressed in human monocytes and GM-macrophages and M-macrophages studied and with cDNAs characterized, for study of gene specificity, disease onset mechanism, drug development and diagnosis.

The present invention describes 100 human genes, which are expressed most frequently in human monocytes. The CDNA of each gene has a sequence fully defined in the specification, and lacking the CATG sequence located adjacent to polyA region. Also described are: (1) an antibody specifically for the protein encoded by any of the genes; (2) oligonucleotides obtained from the CDNA sequences; (3) 380 human genes which are expressed most frequently in human macrophages, differentiated from human monocytes by granulocyte-macrophage colony-stimulating factor, the CDNA of each gene has a fully defined sequence, given in the construction of the genes of (3), and (5) oligonucleotides obtained from the cDNA cany of the genes of (3), and (5) oligonucleotides obtained from the cDNA sequences of (3). The genes and cDNAs, are used for the study of gene specificity and disease onset mechanism e.g. oncogenesis, genetic diseases, drug development and diagnosis. AAAAS6107 to AAAAS6586 represent expressed in monocytes and macrophages
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Genes most frequently expressed in human monocytes and GM-macrophages M-macrophages studied and with cDNAs characterized, for study of gene specificity, disease onset mechanism, drug development and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                           The present invention describes 100 human genes, which are expressed most frequently in human monocytes. The cDNA of each gene has a sequence fully defined in the specification, and lacking the CATG sequence located adjacent to polyA region. Also described are: (1) an antibody capecifically for the protein encoded by any of the genes; (2) oligonucleotides obtained from the cDNA sequences; (3) 380 human genes which are expressed most frequently in human macrophase, differentiated comman monocytes by granulocyte-macrophage colony-stimulating factor, the cDNA of each gene has fully defined sequence, given in the specification, lacking the base sequence CATG located most closely to the specification; (4) and mantbody specifically for the protein encoded by any of the genes of (3), and (5) oligonucleotides obtained from the cDNA sequences of (3). The genes and cDNAs, are used for the study of gene specificity and disease onset mechanism e.g. oncogenesis, genetic specifically claimed oligonucleotide tag sequences for human genes cypressed in monocytes and macrophages
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Sequences AAZ79710-Z79916 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts which are expression) tags used to identify mRNA transcripts which are differentially expressed in a variety of normal or malignant cell types. Some of the transcripts correspond to known genes or ESTS (expressed conference tags) which were previously unknown to be preferentially or differentially expressed in that particular cell type, while other transcripts correspond to novel genes. The invention also provides a nucleotide comprising a promoter sequence derived from one of the conference comprising the polymucleotides of the invention. A nucleotide comprising the polymucleotides of the invention. A nucleotide comprising sequences AAZ79710-Z79916 may be used in diagnostic procedures to characterise a cell of a specific tissue type and to determine whether cell is normal or malignant. They may be used to determine whether the is a normal or malignant. They may be used to screen for agence that modulate expression of differentially expressed genes compound. The promoter/foreign gene construct of the invention may be used for targetted expression of the foreign gene in a particular cell type. For example, a promoter derived from a gene preferentially expressed in dendritic cells (antigen-presenting cells, or APCs), may be operably linked to a sequence encoding an immunostimularory molecule and a sequence encoding an antigen. Such a construct could be transduced into a sequence encoding an immunostimularory molecule and a construct could be transduced into a manume effector cells in vivo, or in cancer immunotherapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            32.3%; Score 8.4; DB 1; Length 10; 90.0%; Pred. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in that particular cell type, while other transcripts correspond to novel genes. The invention also provides a nucleotide comprising a promoter sequence derived from one of the differentially expressed genes, which may optionally be operably linked to a foreign nucleotide sequence, and gene delivery vehicles and host
                                                                       SAGE tag; serial analysis of gene expression; diagnosis; differential gene expression; characterisation; targetted expression; tumour; cancer; immunotherapy; ss.
                                                       Human prostate preferentially expressed gene SAGE tag, SEQ ID NO:101.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polynucleotide useful in cancer immunotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 1; Page 57; 97pp; English.

cells comprising the polynucleotides of the invention. A nucleotide comprising sequences AAZ79710-Z79916 may be used in diagnostic procedures to characterise a cell of a specific tissue type and to determine whether it is normal or malignant. They may be used to screen for agents that modulate expression of differentially expressed genes compound. The promoter/foreign gene construct of the invention may be used for targetted expression of the foreign gene in a particular cell type. For example, a promoter derived from a gene preferentially expressed in dendritic cells (antigen-presenting cells, or APCs), may be operably linked to a sequence encoding an immunostimulatory molecule and a sequence encoding an antigen. Such a construct could be transduced into APCs and would be useful for inducing an immune response by educating immune effector cells in vivo, or in cancer immunotherapy
                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                    임
                                                                                                                                                                                                   expression) tags used to identify mRNA transcripts which are differentially expressed in a variety of normal or malignant cell types. differentially expressed in a variety of normal or malignant cell types. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in that particular cell type, while other transcripts correspond to novel genes. The invention also provides a nucleotide comprising a promoter sequence derived from one of the conformation approaches degenes, which may optionally be operably linked to a foreign nucleotide sequence, and gene delivery vehicles and host cells comprising the polynucleotides of the invention. A nucleotide comprising sequences AAZ79110-Z79916 may be used in diagnostic procedures to characterise a cell of a specific tissue type and to determine whether it is normal or malignant. They may be used to screen for agents that modulate expression of differentially expressed genes compound. The

                                                                                                                                                                                                                                                                                                                                                                                               promoter/foreign gene construct of the invention may be used for targetted expression of the foreign gene in a particular cell type. For example, a promoter derived from a gene preferentially expressed in dendritic cells (antigen-presenting cells, or APCs), may be operably linked to a sequence encoding an immunostimulatory molecule and a sequence encoding an antigen. Such a construct could be transduced into APCs and would be useful for inducing an immune response by educating

The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce
                                                                                                                                                                                                                New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular

cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular

The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular
                                                                                                                                         Human; transcriptome; gene expression pattern; cancer; drug screening; cancer diagnosis; cell specific gene expression; ss.

                                                                                                                                                                                                                                                                         ö
                                                                                                                                     The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention

This invention describes a novel DNA sequence (I) encoding the WTR1 crotein that: (i) has at least one biological activity of a TRP cream that: (i) has at least one biological activity of a TRP creaming the receptor potential) family procein, (ii) is connected with tumors involving Ilp15.5 abnormalities. The products of the with tumors involving Ilp15.5 abnormalities. The products of the invention have anticancer and developmental activity. MRT1 is involved in regulation of intracellular calcium ion levels, which are essential for cellular responses to hormones and/or growth factors; also in apoptosis and cell growth, death and differentiation, and in urogenital diseases, including polycystic kidney disease. (I) and related ribozymes, antisense CR NNA, proteins and antibodies (Ab) are used to treat or prevent diseases consociated with altered expression of the MRT1 gene or activity of its protein, or with calcium influx into cells, e.g. BWS, Wilms tumor, rhabdoid tumors and rhabdomyosarcoma. Probes from (I), or Ab, are also used for diagnosis of such diseases. (I) can also be used for recombinant production of MRT1 proteins (II) (used for analysis, characterization and therack and related sequences, as primers for genetic fingerprinting, as source of oligonucleotides for biochips, and to raise anti-protein or competitive assays for (II), as tissue markers, for identifying competitive assays for (II), as tissue markers, for identifying competitive assays for (II) are used to raise Ab, as reagents in competitive assays for (II) are used to raise Ab, as reagents in the proceins and in screening for (ant) agonists. This sequence contributed in creening for (ant) adonises in the proceins in the proceins and in screening for (ant) adonises. This sequence in the proceins and in screening for (ant) adonises in the proceins in the proceins and in screening for gase and related sequence of punction region described in the purchase of the punction of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
DNA encoding MTR1 protein, useful e.g. for treating Beckwith-Wiedemann syndrome and tumors, also related proteins and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; LPS; lipopolysaccharide; monocyte expression gene; tag; EST; expressed sequence tag; diagnosis; human disease; treatment; ss.

Claim 10; Page 20; 52pp; Japanese.

The present invention describes an lipopolysaccharide (LPS) activated human monocyte expression gene group consisting of the high-ranking 50 genes of the highest expression among the genes expressed by human monocyte stimulated by LPS in which the cDNR of each gene has the base sequence of (AAH32628 to AAH32677) continuous to the base sequence 5'-CATG-3' nearest to the polyA region. The gene group is useful for the development of new means for the diagnosis and the treatment of various human diseases in which human monocyte plays an important role. AAH32628 to AAH32943 represent specifically claimed LPS activated human monocyte expression gene cDNA tags from the present invention. AAH33294 represents an LPS activated human monocyte expression gene cDNA sequence encoding AAB98009, which are given in the exemplification of the present invention

Polynucleotides comprising single nucleotide polymorphisms in the human dopamine receptor D2, useful for detecting mutations associated with, e.g. schizophrenia, Parkinson's and myoclonus dystonia.

Disclosure; Page 25; 135pp; English.

The present invention describes polynucleotides comprising single nucleotide polymorphisms (SNPs) in the human dopamine receptor D2 (DRD2). The polynucleotides may be used in assays to detect and characterise polymorphisms in DRD2 that affect its expression and activity and are involved in disorders such as schizophrenia, Parkinson's and myoclonus dystonia (MD). This information would be useful for studying the biological function of BND2 as well as in identifying drugs targeting this protein for the treatment of disorders related to its abnormal expression or function. Polymorphisms in the DRD2 gene affect the expression of active and functional polypeptides. Therefore it is

advantageous to detect polymorphisms in the DRD2 gene and how those polymorphisms are combined in different copies of the gene. AAF70261 to AAF70308 represent human DRD2 allele specific oligonucleotide probes, and AAF70309 to AAF70404 represent human DRD2 allele specific oligonucleotide primers which are used in the detection of DRD2 polymorphisms. AAF70405 represent oligonucleotide primers for the detection of human DRD2 polymorphisms which are given in the exemplification of the present invention. AAF70453 to AAF70538 represent PCR primers for the human DRD2 gene which are used in examples from the present invention

Morin PJ,

Detecting and identifying ovarian tumor, identifying increased risk for developing ovarian cancer, and determining effectiveness of ovarian cancer treatment, by measuring expression level of ovarian tumor marker gene.

Claim 26; Page 41; 140pp; English.

The invention relates to methods for diagnosing and prognosing ovarian tumours in an individual via the detection and measurement of the expression of ovarian tumour marker genes (ABA83181-ABA83182, ABA83189, ABA83181 or segments thereof (ABA83123-ABA83186, ABA83189, ABA83181 and ABA83183). The methods of the invention are useful for detecting an ovarian tumour in a patient, for identifying an individual at increased risk for developing ovarian cancer, in prognostic tests for assessing the relative severity of ovarian cancer, in tests for

monitoring disease status in a patient being treated for ovarian cancer. The methods can additionally be used to identify a particular tumour as being an ovarian tumour (i.e., an apithelial ovarian tumour selected from serous cystadenoma, borderline serous tumour, mucinous cystadenoma, borderline serous tumour, mucinous ovarian tumour, edear carcinoma, cystadenocarcinoma, cystadenocarcinoma, undifferentiated carcinoma, clear cell adenocarcinoma, archardibroma, adenofibroma and Brenner tumour. The ovarian tumour marker genes of the invention were identified using SAGE (serial analysis of gene expression) and were found to be overexpressed in a broad variety of ovarian epithelial tumour cells relative to normal ovarian epithelial cells. The marker genes are implicated in immune response pathways, in the regulation of cell proliferation and in protein folding, and many of these are membrane-localised or secreted. In addition to their use as diagnostic and prevention of ovarian cancer. Sequences ABA83123-ABA83169, ABA83179, ABA83181 and ABA83183 represent SAGE tags derived from the ovarian tumour monitoring a patient in remission from ovarian cancer and in tests for prognostic markers, the ovarian tumour marker genes or their encoded proteins may be used as therapeutic targets for the treament and marker genes of the invention

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle. Claim 1; Page 386; 419pp; English.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonamnotated OMF) genes comprising a SAGE (serial analysis of gene expression) tag. Also

described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at cleast 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of comprising contacting human DNR with a probe which comprises at least 10 comprision mucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and contitoring expression in the yeast cell of at least 1 NORF genes whose expression is affected by the class of drugs. The NORF genes may be used to identify candidate drugs which affect the cell cycle cycle and for identification of antifungal drugs. AAF33268 to AAF44064 crepresent SAGE tags used in the exemplification of the present invention.

AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present invention.

```
The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate continual drugs comprising: (a) contexting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of varies as in M1, where a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a continuous nucleotides of a NORF gene whose expression is affected by the class of drugs. The NORF gene may be used conspicion of a contiguous nucleotides as markers of phases of the cell cycle. The contiguous mucleoting expression in the yeast cell with a candidate drug and contacting a yeast cell with a method whose expression is affected by the class of drugs. The NORF gene may be used to identify candidate drugs which affect the cell cycle and feet phases of the cell cycle the cell cycle and effect phases of the cell cycle the cell cycle and feet phases of the cell cycle and feet dentify candidate drugs which affect the cell cycle and feet phases of the cell cycle and feet dentify candidate drugs which affect the cell cycle and feet phases used in the exemplification of the present invention the present invention of the present inv
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonamnotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for comprising contacting human DNA with a probe which comprises in the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human DNA with a probe which comprises in INI; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a cyeast cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 1 NORF genes whose cypeasion is affected by the class of drugs. The NORF genes may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonamnotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle sclose and (2/M; (2) a method (M2) for screening candidate bhase of the cell cycle sclose and (2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for contribution buman DNA with a probe which comprises at least 10 contributions nucleotides of a NORF gene whose expression of a NORF gene whose expression in a contiguous nucleotides of a NORP gene whose expression in a contiguous nucleotides of a NORP gene whose expression in a cyeast cell comprising contacting a characteristic effect on gene expression in a cyeast cell comprising contacting a yeast cell with a candidate drug as a member of a cyeast cell comprising contacting a yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to sentification of drugs which affect the cell cycle and for identification of antifungal drugs which affect the cell cycle and for identification of antifungal drugs which affect the cell cycle and for identification of antifungal drugs which affect the cell cycle and for identification of antifungal drugs which affect the cell cycle and for identification of the present invention.

AAF33262 to AAF33267 represent linkers and PCR primers used in the exemplification of the present invention.
                                                                                                                Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Yeast; Saccharomyces cerevisiae; characterisation; cell cycle; NORF; nor previously assigned open reading frame; nonannotated ORF; SAGE; serial analysis of gene expression; antifungal; tag; identification;

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle salected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for comprising contacting a probe which comprises at least 10 contiguous nucleotides of a NORP gene whose expression nucleotides of a NORP gene whose expression in a contiguous nucleotides of a NORP gene whose expression in a cyeast cell of at least 1 NORF gene whose contiguous nucleotides of a NORP gene whose expression in the yeast cell of at least 1 NORF gene whose cyeast cell comprising contacting a yeast cell with a candidate drug and cyeast cell comprising contacting a yeast cell with a candidate drug and cyeast cell comprising contacting a yeast cell with a candidate drug and cyeast cell comprising contacting a yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF gene whose cyeast cell comprising contacting a yeast cell of at least 1 the cile of the strugs which affect the cell cycle and for identification of antifungal drugs which affect the cell cycle and for identification of antifungal drugs which affect the cell cycle and cycle and for identification of antifungal drugs and the present invention.

Cycle and for identification of the present invention.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonamnotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate cantifungal drug; comprising: (a) contexting a test substance which a yeast cell; and (b) monitoring expression of a NORF gene whose expression of varies as in M1, where a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying whose expression varies as in M1; and (4) a method (M4) for identifying a yeast cell with a candidate drug and contacting a yeast cell with a candidate drug and contioning expression in the yeast cell of at least 1 NORF gene whose contidion may be used as markers of phases of the cell cycle. The expression is affected by the class of drugs. The NORF genes may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAF33268 to AAF43367 represent linkers and PCR primers used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Yeast; Saccharomyces cerevisiae; characterisation; cell cycle; NORF; nor previously assigned open reading frame; nonannotated ORF; SAGE; serial analysis of gene expression; antifungal; tag; identification;

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonamontated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate cutifungal drugs comprising: (a) contacting a test substance which a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying the probe which comprises at least 10 comprising contacting human genes which are involved in cell cycle progression contiguous nucleotides of a NORF gene whose expression varies as in M1; cand (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a class of drugs. The NORF genes may be used continuous mucleotides of a NORF gene whose cycle and for identification of an early monitor and affect phases of the cell cycle, the differentially cexpression is affected by the class of drugs. The NORF genes may be used to identification of an early monitor and affect phases of the cell cycle cycle and for identification of an early whose cycle and for identification of an early monitor in the exemplification of the present invention.

Cycle and for identification of an early primers used in the SAGE method, in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                   Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Isolated polymorphic variants of chemokine (C-C motif) receptor 3 (CCR3) gene useful for studying function of CCR3, expressing the CCR3 protein and to screen drugs to treat CCR3 activity-related diseases. Claim 18; Page 13; 53pp; English. 1 CCACCTCATC 10 polymorphisms Homo sapiens. Best Loc Matches RESULT 394 AAD25442/ g ð The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes coding sequence of a yeast gene selected from page 18 ABGE (serial analysis of gene expression) tag. ABGO described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate of antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for contiguous nucleotides of a contiguous nucleotides of a NORF gene whose expression of contiguous nucleotides of a NORF gene whose expression varies as in M1; and (b) muman genes which are involved in cell cycle progression contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a cyeast cell comprising conteacting a yeast cell with a candidate drug and yeast cell comprising conteacting a yeast cell with a candidate drug and cyeast cell comprising conteacting a yeast cell with a candidate drug and conteacting a yeast cell of at least 1 NORF gene whose expressed genes may be used to darnot the vests of phases of the cell cycle. The cycle and for identification of antifungal drugs which affect the coll cycle and for identification of antifungal drugs. AAF33262 to AAF33267 represent linkers and PCR primers used in the exemplification of the present invention. ö Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle. The invention relates to genetic variants of human chemokine (C-C motif)
receptor 3 (CCR3) gene. The invention also relates to compositions and
methods for hablotyping and/or genotyping the CCR3 gene in an individual.
CCC methods for the invention are useful for studying the expression
and function of CCR3 and in expressing CCR3 proteins for use in screening
candidate drugs to treat diseases related to CCR3 activity. They are also
used in gene therapy. The polymorphism and haplotype data is useful for
validating whether CCR3 is a suitable target for drugs to treat type IV
hypersensitivity reactions and human immunodeficiency virus (HIV)-1,
CCC screening for such drugs and reducing bias cells in clinical trials of
such drugs. The genotyping method is useful for determining whether an
individual has one haplotype or haplotype pairs. The haplotyping method
is useful for improving the efficiency and outcome of several steps in
the present sequence is a primer used for detecting human CCR3 gene

The invention relates to a method for haplotyping the cholinergic receptor, nicotinic, epsilon polypeptide (CHRNE) gene (ABL88268) of an individual, and also describes 17 novel polymorphic sites within the human CHRNE gene. The CHRNE pene is located on chromosome 17p13-12 and contains 12 exons which encode a 493 amino acid protein (ABB49112). The CHRNE protein is one of the 5 subunits of mammalian acetylcholine creeptors (AChRs) found at neuromuscular junctions in juveniles and adults, and is essential for the normal postnatal development of skeletal muscle. Mutations in the CHRNE gene ere associated with congenital creeptors (AChRs) found at neuromuscular junctions in juveniles and adults, and is essential for the normal postnatal development of skeletal consistence (CMS). CHRNE gene sequences can therefore be used in mysathenic syndrome (CMS). CHRNE gene sequences can therefore be used in conformation of CHRNE, and in expressing CHRNE protein for use in conformation of CHRNE, and in expressing CHRNE protein for use in an individual, and can also be used in pharmaceutical research to validate condidate drugs for, treating a specific condition drugs or disease condidate drugs for, treating a specific condition drugs or disease condidate drugs for, treating a specific condition drugs or disease configuration using oligonucleotide primers comprising sequences the target region may be determined by the use of allele-specific oligonucleotides (ASOS; ABL88370-ABL88320) as probes and primers, and by primers and reliability of several steps in the discovery and efficiency and reliability of several steps in the discovery and chalsables for treating diseases associated with CHRNE sequences the value of activity, and may be used to screen drugs which target CHRNE sequences the prediction by reliance to the primers used to detect polymorphisms in the CHRNE gene by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, primer, interleukin 12A, IL-12A, drug screening, AIDS, malaria, tuberculosis, cancer, haplotyping, genotyping, transgenic animal, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
Novel genetic variants of cholinergic receptor, nicotinic, epsilon by golypeptide gene useful in studying expression and function of the protein, and for screening drugs to treat diseases e.g. congential myasthenic syndrome.

The invention comprises the amino acid and coding sequence of the human interleukin 12A (IL-12A) protein. Specifically the invention relates to the identification of polymorphisms within the human (IL-12A) gene sequence. The polymorphisms identified in the human IL-12A gene sequence are useful in studying the expression and function of IL-12A, and in tuberculosis for the treatment of disorders such as AIDS, malaria, tuberculosis and cancer. The IL-12A polymorphisms may be used to haplotype and genotype the IL-12A gene of an individual. The IL-12 DNA studying expression of the IL-12A gene of an individual. The IL-12 DNA studying expression of the IL-12A isogenes in vivo. The present DNA sequence represents a human interleukin 12A (IL-12A) gene primer
                                                                                                                                                                                                    New interleukin 12A (IL-12A) gene polymorphic variants, for studying expression and function of IL-12A and screening candidate drugs for treating AIDS and cancer.

New polynucleotide containing polymorphisms in the human sodium channel voltage gated type 2 beta polypeptide (SCN2B) gene, for developing drugs for treating demyelinating diseases.

This invention relates to an isolated polynucleotide which is a polymorphic variant of a reference sequence for sodium channel voltage Claim 17; Page 13; 63pp; English.

gated type 2 beta polypeptide (SCNZB) gene. The methods have applicability in developing diagnostic tests and therapeutic treatments for demyelinating diseases. The protein is useful for studying the expression and function of SCNZB and expressing SCNZB protein for use in screening for candidate drugs to treat diseases related to SCNZB contribly. The polymorphism and haplotype data are useful for validating whether SCNZB is a suitable target for drugs to treat demyelinating chasases, screening for such drugs and reducing bias in clinical trials. The haplotyping method is useful to validate SCNZB as a candidate target for treating a specific condition or disease predicted to be associated with SCNZB activity. A recombinant non-human organism transformed or transfected with the polypeptide is useful for studying expression of the SCNZB isogenes in vivo, for in vivo screening and testing of drugs and compounds for demyelinating diseases in a biological system. This sequence is used during the detection of polymorphisms of the SCNZB gene ö New genetic variants of Homeo Box D3 for studying expression and function of the protein, and for screening drugs to treat diseases e.g. developmental disorders and tumors. The invention relates to genetic variants of the homeo box D3 (HOXD3) gene. HOXD3 gene includes 9 polymorphic sites PS1-PS9. Haplotypes (HTS) or haplotype pairs (HP) for PS1-PS9 in the HOXD3 gene are useful for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with HOXD3 activity, e.g., developmental disorders and tumours. HOXD3 isogene is useful in studying the expression and function of HOXD3 and in expressing HOXD3 protein for use in screening for candidate drugs to treat diseases related to HOXD3 activity and in studying the effect of Human, homeo box D3; HOXD3; polymorphism; developmental disorder; haplotype; HT; allele-specific oligonucleotide; ASO; tumour; therapy; drug screening; cytostatic; primer; 88. ö pharmaceutical research scientist to validate CRYBB1 as a candidate target for, and in design of clinical trials of candidate drugs for, treating a specific condition drugs or disease predicted to be associated with CRYBB1 activity. The ASOs are useful as probes and primers, and for assaying a polymorphism in the target region. The present sequence is the allele specific 3' end of a PCR primer used in primer extension experiment to detect polymorphisms in CRYBB1 The invention comprises the human lysosomal acid phosphatase 2 (ACP2) nucleic acid and protein sequences. Specifically, the invention relates to the discovery of 22 novel polymorphic sites within the APC2 gene. The invention also comprises methods for haplotyping and genotyping the ACP2 gene in an individual. The ACP2 gene (located on chromosome 11) encodes a lysosomal-specific enzyme that catalyses the hydrolysis of orthophosphoric monoesters to alcohol and phosphate. The ACP2 gene and protein are pharmaceutically important in the treatment of Hodgkin's protein are pharmaceutically important in the treatment of Hodgkin's polymorphisms of the invention are useful in haplotyping the ACP2 gene. ACP2 haplotyping is useful in validating ACP2 as a target (and designing divise) for treating an ACP2-related disease or condition (e.g. Hodgkin's disease and acid phosphatase deficiency. The ACP2 gene polymorphisms are useful for ACP2 genotyping, which can also be used to develop diagnostic Human; ss; lysosomal acid phosphatase 2; ACP2; gene; chromosome 11; lysosome-specific enzyme; orthophosphoric monoester hydrolysis; Hodgkin's disease; HD; acid phosphatase deficiency; novel polymorphic site; ACP2 haplotype; ACP2 genotype; polymorphism; transgenic animal; pirimer; probe; primer-extension oligonucleotide; SNP; single nucleotide polymorphism. Novel genetic variants of acid phosphatase 2, lysosomal polypeptide gene useful in studying expression and function of the protein, and for screening drugs to treat diseases e.g. Hodgkin's disease. which is a polymorphic variant of a reference sequence for the human smoothened brosophila homologue (SMOH) gene or its fragment, or a smoothened brosophila homologue (SMOH) gene or its fragment, or a polymorphic variant of a reference sequence for a SMOH CDNA or its fragment. A new isolated polypeptide is useful for screening for drugs targeting the polypeptide. A new method is useful for identifying an association between a trait such as a clinical response to a drug targeting SMOH and a haplotype or haplotype pair of SMOH gene. The methods have applicability in developing diagnostic tests and therapeutic reatments for basal cell carctinomas (BCCs). The isolated polymucleotide is useful for studying the expression and function of SMOH and expressing SMOH protein for use in screening for candidate drugs to treat diseases related to SMOH activity. The polymorphism and haplotype data are useful for validating whether SMOH is a suitable target for drugs to treat BCCs, creening for the drugs and reducing bias in clinical trials of the drugs. The isolated polymucleotide is useful for therapeutic purposes.
                                                                                                                                                                                                                                                                                                                    ö
tests and therapeutic treatments. The ACP2 protein and nucleic acids of the invention are useful in the production of a transgenic animal which expresses ACP2 protein. The ACP2 nucleic acids of the invention are useful in the production of allele-specific oligonuclectides designed to genotype each of the ACP2 polymorphisms. Nucleic acids ABL36299-ABL36320 represent claimed ACP2 allele-specific probes. Nucleic acids ABL36321-acids ABL36364 represent claimed ACP2 allele-specific PCR primers. The invention relates to detecting CC (colorectal cancer e.g. colorectal adenoma), comprising: (a) detecting macrophage inhibitory cytokine (MIC) or renal dipeptidase (RDP) in faeces or blood of a subject and comparing amount of MIC or RDP detected to that in normal subjects, where an elevated amount of MIC or RDP in the subject is an indicator of CC in subject; (b) isolating mRNA sample from faeces of a subject, detecting MIC or RDP mRNA in the mRNA sample, and comparing amount of MIC or RDP mRNA in the subject is an indicator of CC in subject; (c) isolating epithelial cells from blood of a subject, isolating an mRNA sample from faeces of a subject or epithelial cells, detecting MIC or RDP mRNA in the mRNA sample, and comparing the amount of MIC or RDP mRNA in the mRNA sample.

The mRNA sample to amounts of MIC or RDP mRNA in normal subjects, where an elevated amount of MIC or RDP mRNA in the mRNA sample or amounts of MIC or RDP mRNA in the mRNA sample or amount of MIC or RDP mRNA in the mRNA sample to amount of MIC or RDP mRNA in the blood or faeces of a subject; with an elevated amount of MIC or RDP mRNA in the blood or faeces of a subject sample comparing the amount of activity of RDP in the blood or faeces of the subject
                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting colorectal cancer in a subject, involves detecting macrophage inhibitory cytokine or renal dipeptidase or their mRNA in feces or blood of the subject.
                 for determining whether an individual has one of the haplotypes or the haplotype pairs. The polymuclectides of the invention can be used to treat disorders by gene therapy and antisense gene therapy. This polymuclectide sequence represents a primer used for detecting human smoothened Drosophila homologue gene polymorphisms of the invention
  new method, an oligonucleotide and kit of the invention are useful
                                                                                                                                                                                                                            Gaps

.

to that in normal subjects, where an elevated amount of activity of RDP subject; (e) administering to a subject is an indicator of CC in the subject; (e) administering to a subject an antibody which specifically binds to RDP or an inhibitor of RDP, where the antibody or inhibitor is labeled with a moiety which is detectable from outside of the subject and acteding the moiety with in the subject from outside of the subject and area of localisation of the moiety within the subject but outside the proximal tubules of the kidney identifies CC; or (f) administering to a subject a substrate for RDP, the substrate being labeled with a detectable moiety, isolating faces or blood from the subject, and detecting in the faces or blood MDP reaction product or RDP substrate with the detectable moiety, where increased product or decreased cut the faces or blood indicates CC in the subject. The methods are useful for detecting colorectal cancer in a subject. The present sequence is a DNA tag derived from a human transcript whose expression is ö The invention relates to gonadotropin-releasing hormone 2 (GNRH2) and its nucleic acid sequence. Polymorphic variants of the GNRH2 gene are useful in studying the expression and function of GNRH2, and in expressing GNRH2 proteins for use in screening candidate drugs for treating diseases associated with GNRH2 activity, such as reproductive disorders. Polymucleotides comprising a polymorphic gene variant or fragment may be used for therapeutic purposes, where a patient could benefit from expression or increased expression of a particular GNRH2 protein isoform, or an expression vector encoding the isoform may be administered to the New gonadotropin-releasing hormone 2 (GNRH2) polypeptide encoded by genetic variants having polymorphisms in the GNRH2 gene, for studying the function of, and treating disorders, such as, reproductive disorders. patient. Haplotype information is useful in improving the efficiency and output of several steps in a drug discovery and development process, including target validation, identifying lead compounds, and early phase clinical trials. GNRH2 gene is used in gene therapy. The present sequence is a primer used for detecting human GNRH2 gene polymorphisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention comprises a method for the PCR amplification of nucleic acids. The method involves a set of primers, where two of the primers are in solution and at least two other primers are atrached to a solid support. The method of the invention can be used for the analysis of a nucleic acid or a mixture of nucleic acids, including: single-stranded present DNA molecules, double-stranded DNA molecules, acut of the invention amplified polymorphic DNA (RAPD) PCR primer of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Amplification of nucleotide sequences from polynucleotides by chain extension of oligonucleotide primers, comprises 2 oligonucleotides in solution, 2 attached to supports and both share complementary sequences.
                                                                                                                                                                                 Gaps

This invention relates to a novel method for the optimisation of primer libraries. Specifically, it refers to increasing the affinity of short oligonucleotide primers, also known as extendable oligos (BOS), for their template sequences. The present invention describes improved methods for sequenching and the linear and exponential amplification of DNA that can be useful for PCR, RT-PCR, ligation chain reaction (LCR), rolling circle amplification, strand displacement amplification and isothermal DNA amplification. Accordingly, these extendable oligos with improved specificity and affinity are particularly important in fields ranging from biotechnology and agriculture to medical research. This oligonucleotide sequence is an extendable oligonucleotide that includes an adenine replacement 2,4 diaminopurine nucleotide analogue in the catch region, and is useful for both DNA sequencing reactions and PCR amplification in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Increasing the affinity of an extendable oligonucleotide (EO) for a target nucleic acid, for providing primers having improved specificity, comprises hybridization of the EO to a template oligonucleotide (TO) and extension of the EO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

New Kit comprising a set of oligonucleotides, useful for determining whether an individual has a statin response marker I or II for preparing composition for treating hyperlipidemia.

Disclosure; SEQ ID NO 171; 202pp; English.

A kit comprising a set of oligonucleotides designed for identifying at least one of the alleles at each polymorphic sites (PS) in a set of lag bate one of the alleles at each polymorphic sites (PS) in a set of lag purpose of the alleles at each polymorphic sites (PS) in a set of polymorphic sites (PS) given in the specification, for each polymorphic sites comprising a linked haplotype for any one of haplotypes (DI) and PSA; PSI3 and PSA2; and PSA2; as set of polymorphic sites comprising a linked haplotype for any one of haplotypes (DI) 134, 201-463 or 501-515 given in the specification; or a set of polymorphic sites comprising a substitute haplotype for any one of haplotypes 101-134, 201-463 or haplotypes 501-515 given in the specification; where the nucleotide position of each polymorphic site comprising a substitute haplotype for any one of paplotypes 101-134, 201-463 or haplotypes 501-515 given in the specification; where the nucleotide position in the 3257-bp corresponds to the following nucleotide position in the 3257-bp corresponds to the following nucleotide position in the 3257-bp corresponds to the following nucleotide position in the 3257-bp corresponds to the following nucleotide position in the 3257-bp corresponds are at an included for: determining whether an individual has a stain response marker I or a stain response marker I or a stain response marker I or a stain response are at a stain response marker I or a stain response to treatment with a stain; manufacturing a drug product comprising a stain response marker I, an area of the following an individual? High Density Lipoprotein Cholesterol (HDLC) response to treatment with a stain; marketing a grain response marker I, an isolated polymuclocide comprising a stain response marker I, an isolated polymuclocide comprising a stain response marker I, an isolated polymuclocide comprising a stain response marker I, an isolated polymuclocide comprising a stain response marker I, an isolated polymuclocide seeking response marker I; an isolated polymuclo recombinant nonhuman organism transformed or transfected with the isolated polynuclectide, where the organism expresses an ITGB3 isolated polynuclectide, where the organism expresses an ITGB3 polypeptide encoded by the selected ITGB3 isogene; an isolated fragment comprises one or mom polymorphisms consisting of thymine at PS 1, quanine at PS 2, thymine at PS 3, thymine at PS 4, cytosine at PS 5, adenine at PS 6, thymine at PS 9, thymine at PS 9, adenine at PS 10, adenine at PS 11, thymine at PS 19, quanine at PS 10, adenine at PS 11, thymine at PS 19, quanine at PS 11, quanine at PS 19, quanine at PS 17, thymine at PS 19, adenine at PS 19, adenine at PS 19, thymine at PS 19, adenine at PS 10, adenine at P of isogenes 1-98, where each of the selected isogenes is defined by a correspondingly numbered haplotype given in the specification, and where each of the isogenes comprises nucleotides 1000-2235, 4256-4716, 13179-13723, 1435-14858, 16126-16619, 1639-17414, 19241-19644, 19748-20177, 2053%21009, 21731-22412, 24385-24930, 2555926609, 27822-28255, 30265-30754, and 31300-31718 of the 32577-bp sequence except where substituted

where the comparison of the correspondingly numbered hablotyee at each of file of an individual; assigning a haplotyee pair for the integril, beta of each of an individual; assigning a haplotyee pair for the integril, beta of the comparison and the comparison and the control of the control population partly or wholly defined by having a statin response marker I, where a trial population having the statin response marker substitution having the statin response marker exhibits a better HDLC response to the pharmaceutical formulation than to treatment with atorvastatin or a salt of atorvastatin acid. Preferred Oligonucleotide: The isolated oligonucleotide is an allele-specific alignment of a partle of the precipitation of the polymorphic site. The isolated oligonucleotide is a primer-extension oligonucleotide. The kit is for

CC comprises a set of oligonucleotides designed for identifying at least one comprises a set of oligonucleotides designed for identifying at least one comprises a set of oligonucleotides designed for identifying at least one of the alleles at each polymorphic site (BS) in a set of two or more has a statin response marker II comprises determining the copy number in the individual of the haplotype, where if the selected haplotype is one of haplotypes given in the specification, the selected haplotype is one of the selected haplotype and a statin response marker I if the individual has a statin response marker I if the individual has a statin response marker I if the individual has a statin response marker I if the individual has a statin response marker I if the individual has a statin response marker I if the individual has a statin response marker I if the individual has a statin response marker I if the individual is a candidate for treatment with a statin. The determining step comprises concerned to copy of the selected haplotype and using the results of the genotyping step to identify. For the set of polymorphic sites the haplotype and the individual. The determining step comprises consulting a data repository, that provides information on the copy number present in the individual or the selected haplotype. The data repository is the individual to a first or second statin response marker group if the individual has at least one copy of the selected haplotype and to the first statin response marker group if the individual has at least one copy of the selected haplotype and assigning the individual to the first statin response marker group if the selected haplotype and to the second statin response marker group if the selected haplotype and to the second statin response marker group if the selected haplotype and to the second statin response marker group if the selected haplotype and to the second statin response marker group if the selected haplotype and to the second statin response marker group if the selec ö Score 8.4; DB 1; Length 10; Pred. Example 2; SEQ ID NO 599; 149pp; English.

The invention relates to a method of diagnosis (M1) comprising: (a) providing a test sample of breast tissue; (b) determining the level of expression in the test sample of a gene (e.g. interleukins, superoxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the specification, and (c) if the gene is expressed in the test sample at a lower level than in a control normal breast tissue sample, diagnosing the test sample as containing cancer cells. The method is used for diagnosing breast cancer. This sequence corresponds to an oligonucleotide primer used in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method of diagnosis (M1) comprising: (a) providing a test sample of breast tissue; (b) determining the level of expression in the test sample of a gene (e.g. interleukin-8, superoxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the specification, and (c) if the gene is expressed in the test sample at a lower level than in a control normal breast tissue sample, diagnosing the test sample as containing cancer cells. The method is used for diagnosing breast cancer. This sequence corresponds to an oligonucleotide primer
breast cancer. This sequence corresponds to an oligonuclectide primer used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Diagnosing breast cancer comprises determining expression levels of a gene selected from those differentially expressed in normal or cancerous cells of a breast tissue sample including interleukin 1, thrombospondin 1
                                                                                                         Gaps

The invention comprises a method of screening for candidate agents capable of altering the biological activity of a protein encoded by a nucleotide involved in hypoxia-related tumourigenesis. The method of the involves is contacting a test agent with a target cell expressing the nucleotide, and monitoring the activity of the expressed protein product; if the test agent modifies the activity of the expressed protein then this is a candidate agent. The method of the invention is useful for modifying hypoxia-induced gene regulation and for diagnosing, prognosing or treating tumours. The present DNA sequence represents a SAGE tag that was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying agents that alter biological activity of a polypeptide encoded by a polynucleotide involved in hypoxia-related tumorigenesis comprises contacting an agent with a target cell and monitoring activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
